

Plant anatomy and basic respiration

hands-on project. building a water / plant / animal ecosystem.

Students coloring their ecosystem diagrams

Stage 1 finished !

Summer with a Difference 2010

Week 2 Update

Featured teacher: Mr Peter Hung (British) High school math and elementary science

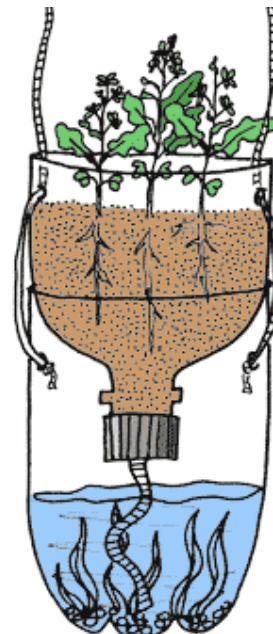

Dear Parents,

My name is Mr. Peter and I am teaching science for elementary students this summer. In our discovery class, as part of our focus on environments and our trip to Go Gibbon in Chomburi's protected national park, we have been building 'bottle habitats'.

These are made from drinking water bottles and contain fresh water fish and plants. The students will also add different species of water snail and have the opportunity to observe their fish breeding. The aim of the project is for student to make careful observations of how different living organisms interact in an ecosystem. Then, during our trip to Go Gibbon, students will have the chance to see first-hand many of the organisms that are native to Thailand's original and unspoiled forest, and to talk with Go Gibbon Sky Rangers about this fascinating natural ecosystem. At the end of the summer school, the students will be able to bring home the complete bottle habitat.

We are also investigating growing different seeds, and the pupils are finding out about what conditions are needed for seeds to germinate and grow healthily.

As the summer school progresses we will look at some other simple science experiments and will also be constructing paper and balsa wood gliders. If you have any questions, or you would like to stop by during a lesson, please feel free to do so.
